# Alignment vs Assembly vs Pseudoalignment

Kelsy Cotto, Obi Griffith, Malachi Griffith, Saad Khan, Allegra Petti, Huiming Xia

Informatics for RNA-seq Analysis

June 17-19, 2020

# Assembly

- Infer transcript structure directly from the data
- Useful when you do not have a reference sequence
- Other uses – highly rearranged genomes (some cancers)
- Computationally expensive
- Tools: Trinity, Velvet, SPAdes

Haas, et al (2013) doi: 10.1038/nprot.2013.084

# Alignment

- Uses a reference genome/transcriptome to map reads
- Capable of some novel transcript inference
- Relatively fast runtime
- Tools: HISAT2, STAR, GSNAP

Kim et al. 2015. Nat Methods 12:357–360

# Pseudoalignment

- Does not determine where in the genome a read lies, only which transcripts it is compatible with
- Very fast!
- Does not produce a bam by default (though pseudo-bams can be created), not useful for variant detection.
- Tools: Kallisto, Sailfish

Bray, 2016 doi:10.1038/nbt.3519
